

# Kohimarama Forest

What if Kererū started nesting in our urban forests?

What if Banded Kōkopu could swim upstream to lay their eggs under the shade of our native ferns?

What if we could rest under an ancient stand of Kohekohe trees without an hours drive?

This is already happening — in a forest that provides a stepping stone between the predator free islands of the Hauraki Gulf and forest sanctuaries on Auckland's mainland.

**Kohimarama Forest is now for sale and we must save it for future generations.**

The forest is a hive of activity for volunteers wanting to learn how to work with nature.

**What if, instead, Kohimarama Forest became a centre for urban forest restoration where universities, local schools, community groups and businesses learn about biodiversity conservation and can observe ecological intelligence at work?**
